What do I want to learn or understand better?

This was the last sprint and before I started coding this week I wanted to understand how it was possible to save information when the app was restarted. What I did in the beginning was to do some research and try to find different types of ways that matched our code-situation.

Furthermore my coding partner had done a similar task before and she guided me through it so that I understood better.

I am very curious about how the application will be used in the future. The mvp we have created is fully functional and has all of the main functions implemented. The only things missing to be used by our stakeholder is the log-in part. This is something I am curious about how it could be implemented. By doing research and maybe ask some classmates about this, I think I will get a better understanding of how it could be implemented.

How can I help someone else, or the entire team, to learn something new?

This week, the last sprint, I worked with Linnéa. We together taught each other different things and methods to achieve the results we were looking for. Something I helped with was the process to convert the save-method from handling strings to handling ints and the small errors that occurred when this wasn't done in the right way.

I am the one who will do the presentation of our project. When doing it I might give some inspiration of how small tips and trix can make the whole presentation.

What is my contribution towards the team's use of Scrum?

This sprint me and my coding-partner got two user stories to work on. They were both good estimates and by working on them together we created value for the stakeholder.

Further I have been doing my part of what the sprint backlog of this sprint said we should do.

This sprint me and Rebecka were co-scrum-masters. We led the meetings and together tried to have an overview of all our work and tried to have an open dialog in our meeting so that everyone got their thoughts on the table.

Also I had close communication with our Stakeholder and scheduled a meeting with her. After the meeting with her I made sure that we didn't forget about her feedback. I have also answered some of her questions regarding the extra pointers she had for us to work on in the last sprint.

What is my contribution towards the team's deliveries?

This week me and my coding partner for the week worked on two user stories. First we filled out some more companies and made sure that they had the right information presented in them. We also made sure that the user could save a company as a favorite and then when closing down the app and then restarting it, it would be as the user left it (and all changes remained).

As usual I also participated in all of the meetings where we constantly form discussions where we can learn and develop ourselves and the application. We merged our code and saw that there were no conflicts and that the application was runnable after the run.
